CREATININE

TEST NAME	RESULT	UNIT	BIOLOGICAL REFERENCE INTERVAL
Creatinine	: 0.8	mg/dL	0.7 - 1.2

Method: Jaffe Kinetic IDMS traceable

Interpretation / Comments :

- Useful in the diagnosis of renal insufficiency and is more specific and sensitive indicator of renal disease than BUN.
- Use of simultaneous BUN and creatinine levels provide more information in the diagnosis of renal insufficiency.

GLYCATED HAEMOGLOBIN (HbA1C)

TEST NAME	RESULT	UNIT	BIOLOGICAL REFERENCE INTERVAL
Glycated Haemoglobin	: 4.9	%	Non Diabetic : < 5.6 Pre - Diabetic Range : 5.7 - 6.4 Diabetic Range : >= 6.5

Method: High performance liquid chromatography

Interpretation / Comments:

- Glycated hemoglobin is proportional to mean plasma glucose level during previous 6-12 weeks.
- Values may not be comparable with different methodologies and even different laboratories using same methodology.
- Perform A1c at least twice annually in diabetes patients to ascertain meeting of goals.
- Perform A1c test quarterly in diabetes patients whose therapy has changed and who are not meeting goals.
- Recommended goal of A1c is < 7%.
- ADA guidelines 2022.

Interpretation / Comments :

- Lipid profile is a panel of blood tests that serves as an initial broad medical screening tool for abnormalities in lipids, the results of this tests can identify certain genetic diseases and can determine approximate risks for cardiovascular disease, certain forms of pancreatitis and other diseases.

THYROID PROFILE

TEST NAME	RESULT	UNIT	BIOLOGICAL REFERENCE INTERVAL
T3 Total <i>Method: Chemiluminiscence Immunoassay</i>	: 1.03	ng/mL	0.60 - 1.81
T4 Total <i>Method: Chemiluminiscence Immunoassay</i>	: 8.00	µg/dL	3.2 - 12.6
TSH - Ultrasensitive <i>Method: Chemiluminiscence Immunoassay</i>	: 4.120	µIU/mL	0.55 - 4.78

Interpretation / Comments :

- Patient preparation is particularly important for hormone studies, results of which may be markedly affected by many factors such as stress, position, fasting state, time of the day, preceding diet and drug therapy.
- The levels of T3 helps in the diagnosis of T3 thyrotoxicosis and monitoring the course of hyperthyroidism. T3 is not recommended for diagnosis of hypothyroidism as decreased values have minimal clinical significance.
- Values below the lower limits can be caused by a number of conditions including non-thyroidal illness, acute and chronic stress and hypothyroidism.
- Elevated level of T4 are seen in hyperthyroidism, pregnancy, euthyroid patients with increased serum thyroxine binding globulin.
- Decreased levels are noted in hypothyroidism, hypoproteinemia, euthyroid sick syndrome, decrease in thyroxine binding globulin.
- TSH levels are increased in primary hypothyroidism, insufficient thyroid hormone replacement therapy, Hashimoto's thyroiditis, use of amphetamines, dopamine antagonists, iodine containing agents, lithium and iodine induced or deficiency goiter.
- Decreased levels of TSH may be seen in graves disease, toxic multinodular goitre, thyroiditis, excessive treatment with thyroid hormone replacement and central hypothyroidism.
